NAVER LABS

Creating new connections between people, machines, spaces and information

NAVER, a recognised leader in internet content services, also creates core technology in artificial intelligence, robotics and autonomous driving to apply services to offline platforms and the physical spaces in our daily lives. This cutting-edge research is done in NAVER LABS, NAVER's global R&D arm based in Korea and France and part of an international AI research hub with partners around the world.

NAVER LABS Europe

Areas of focus
AI for Robotics, Ambient Recommendation, Trusted AI

Applications
Autonomous robotic navigation, HRI,
machine translation, machine reading,
news recommendation, semantic mapping,
localization, multimodal mobility, multimodal search.

NAVER LABS Europe is the biggest industrial research lab in artificial intelligence in France.

Computer Vision and 3D Vision
Building a coherent interactive picture of the environment and the people and objects within, to create agents that can help navigate and guide us. Taking this ambient intelligence to the edge, we optimize algorithms and processes to improve the user experience and user privacy.

Natural Language Processing
Understanding, generating and translating text from unstructured, often user generated content. The power and flexibility of deep neural networks is combined with rich prior knowledge for better results with less training data.

Machine Learning & Optimization
Developing models, algorithms and tasks as the building blocks of AI and decision making with a focus on optimization in uncertainty, differentiable reasoning and machine reading.

Search and Recommendation
Designing search and recommendation modules that are human-centric, context-aware, personalized, anticipatory and collaborative to help people navigate and interact in the physical and digital worlds.

Systemic AI
At the crossroads of AI and software engineering research we address the challenges of integrating AI/ML components in large-scale, complex, dynamic environments.

UX and Ethnography
Combining design expertise and ethnomethodological studies to understand people and create services that are appropriate for ambient and augmented environments.

Enquiries

europe.naverlabs.com

NAVER LABS Europe is looking for talented people who
- like to take on new challenges
- collaborate beyond team boundaries
- believe in user value above all else.

Job and internship opportunities are posted throughout the year.

NAVER LABS Europe in Grenoble, France

In today's complex environment we need technology that can help us seamlessly interact and find information in and across our digital and physical worlds.
